

Fair Selection Guide

Synthetic training material for a local demonstration. Apply the organization's approved process; this document is not legal advice.

Consistent criteria

Define essential and preferred criteria before reviewing applications, apply them consistently, and record job-related reasons for exceptions.

Use structured questions and anchored scoring rather than informal comparisons between candidates.

Review aggregate selection patterns with authorized human oversight; this synthetic guide does not supply legal thresholds or conclusions.

Avoiding proxies

Do not use protected characteristics or indirect proxies unrelated to the job, including name, age, family status, photograph, school prestige, or unexplained employment gaps.

Assess only evidence tied to essential duties. If a signal is not a documented criterion, exclude it and flag the concern.

Do not infer a protected characteristic from candidate text or ask the model to predict one.

Adverse impact review

An authorized human owner may review aggregate outcomes using an approved, privacy-protective process.

Do not infer protected traits from names or profiles, and do not expose individual sensitive information to screeners for this analysis.

The copilot cannot determine legal compliance; refer potential concerns to qualified internal reviewers.

Accommodation requests

Acknowledge the request neutrally and refer it to an authorized human reviewer through the established confidential process.

Assess the essential job-related skill using a consistent, appropriate method; the request itself is not negative evidence.

Do not ask the model to assess medical details or decide whether an accommodation is required.

Decision accountability

The named human reviewer owns the final screening outcome and must inspect the evidence and rubric before acting.

The reviewer may approve, reject, edit and approve, or escalate a draft. Edits must retain before-and-after values and a reason.

An AI-generated recommendation is never a final decision and must not be executed without explicit reviewer approval.
