

Reviewer Operating Guide

Synthetic training material for a local demonstration. Apply the organization's approved process; this document is not legal advice.

Review queue

Reviewers inspect each pending draft, its job-related evidence, citations, and flags before taking action.

If evidence or citations are missing, do not approve automatically; request clarification or reject with a reason.

The queue status records the review state; only approved or edited drafts may proceed to execution.

Approve

Approve only when the recommendation is supported by cited role evidence, applies the correct rubric, and has no unresolved flag.

Approval records the reviewer identity and time. A separate authorized execute step records the final screening decision.

If the draft needs changes, edit and approve rather than approving a known error.

Source: policy-reviewer-guide.pdf, section 2.

Reject

Reject a draft that is unsupported, out of scope, materially biased, or otherwise unsuitable for execution.

Record a concise reason so the action can be audited. A rejected draft must not create a final screening decision.

If more evidence could resolve the concern, escalate or request it through the approved human process.

Edit and approve

Correct the decision or rationale using documented role evidence; do not introduce unsupported claims.

Record the original draft, edited payload, reviewer, time, and reason, then approve the edited version.

The edited payload must retain the same candidate and run identity and satisfy the allowed decision schema.

Escalation

Pause the workflow when evidence conflicts, a required criterion is unclear, a possible accommodation is raised, or the record may be biased or incomplete.

Send the issue to the designated authorized human owner with only the minimum necessary candidate information.

Resume only after the issue is resolved and the rationale is recorded; never let an AI fallback make the final decision.
